Part I: Market Report Evaluation

The higher education market is constantly evolving, and multiple reports conducted by various companies evaluate that market and gather their results into a report called a market analysis or report. There was a report published by the company Technavio in March 2026 titled, “Higher Education Market Analysis, Size, and Forecast 2026-2030”. This report examines the higher education market on a global scale from 2020-2024, using 2025 as the base year, and forecasts the market through 2030. Technavio is a research and advisory company that specializes in producing reports that analyze size and trends in the present state of various markets and future projections of how those markets will change. This report includes qualitative and quantitative data pulled from primary and secondary sources. This paper examines the higher education market analyzed within this report, which will cover major takeaways and themes, and future projections for the market.

As mentioned above, the report covers the higher education market on a global scale. The higher education market refers to all postsecondary institutions, services, programs, and digital tools that offer academic, vocational, and professional education beyond high school. In this report, Technavio examines the market through different segments to get a holistic view of where the market stands and where it is going. The report categorizes the market by learning methods including online, offline, and hybrid education: end-user including private colleges, state universities, and community colleges; course levels including undergraduate, masters, and PhD; geography which examines the market across major global regions. By segmenting the report,

companies such as Technavio are able to analyze the higher education market from different angles to determine where there is growth in the market, where there is demand, and where opportunities may be. This report provides an overview of the current state of the market by identifying the factors influencing the development and potential growth of the higher education market.

This report showed many main themes and findings based on qualitative and quantitative data. Higher education is evolving from a traditional, degree-centered model to a more flexible, technology-supported, and career-centered model. This claim was based on numerous themes within this report starting with the continued growth of online education (Figure 1) as institutions around the world respond to learners who need educational opportunities that align with their personal and professional schedules. Technavio describes online learning as being "propelled by learner demand for flexible and accessible learning," particularly for non-traditional students and working professionals (Technavio, 2026). You can also see a shift in the use of advanced technologies and innovative pedagogical methods, one of which being artificial intelligence. For example, the report mentions the use of AI in predictive analytics to aid in student retention or usage of AR and VR in medical education to increase hands-on training. Another major theme is the movement away from traditional long-term degree pathways toward more flexible and career-aligned methods of education. The report emphasizes the "unbundling" of traditional degrees into a flexible method where you can accumulate micro-credentials and digital badges that the workforce and employers are starting to appreciate therefore, flexible environment and

delivery methods allows learners to develop and demonstrate specific skills while continuing their education throughout their careers (Technavio, 2026). Lastly, a major finding is that the private colleges segment accounted for the largest market revenue share in 2024. Overall, all of the major themes and findings in this report suggest the increasing offerings of flexible learning options, the inclusion of innovative technology supports, and educational experiences that better align with skills and career outcomes in higher education.

Figure 1

The future of the higher education market is an exciting one. Technavio projects substantial growth in the global higher education market between 2026-2030. The online

Professor Barnshaw

learning segment is expected to experience significant growth due to institutions around the world having to respond to the increasing demand of flexible educational opportunities. Technavio notes that the online segment is estimated to have significant growth for the foreseeable future with the value in 2024 being USD 56.71 billion and has only shown increase during the forecast period. Because of this trend and driver in the market, they also project that continued innovation in pedagogical approaches to strengthen the quality of online education. North America is projected to remain the leading contributor, currently accounting for 41% of the market's growth due to their prestigious institutions and strong research infrastructure (Technavio, 2026). In addition, Technavio identifies more factors that are driving the growth of the market such as the increasing global demand for a skilled workforce, advancing technology integration and proliferation of digital learning models, and accelerating internationalization and global student mobility (Technavio, 2026). Even though these trends are driving the market growth, there are projected implications that will present challenges that stakeholders may need to take into account and prepare for. Challenges that face the market are system funding pressures and affordability crisis, the widening disconnect between curriculum and employer demands, and unfavorable demographic trends like the cleft in birth rates which increase global competition. These projected implications are explicitly stated with the expectation that institutions will adapt to the forever evolving higher education market by expanding flexible learning opportunities, integrating emerging technologies, and developing programs that prepare students with visible skills for the workforce.

Technavio's report shows significant changes and great promise for growth in the market due to technological advancements and a shift in values within the field of higher education due to the demand of skills in the workforce. The projected growth of online and flexible learning, increased use of advanced technology, and expansion of micro-credentials and career focused education suggests that the higher education market will continue moving in a more adaptable and skills-oriented direction. Post graduation outcomes are becoming a major metric of institutional effectiveness, with greater emphasis being placed on whether educational programs provide students with meaningful career opportunities and support socioeconomic mobility (Technavio, 2026). Ultimately, the future of the higher education market will not only depend on its ability to grow, but on its ability to demonstrate meaningful outcomes for students and the workforce.

Part II: My Perspective

Overall, I generally agree with this report because I think this captures the technological advancement and how it has affected higher education. It also takes into account the impacts that it has had on the market, whether that be a challenge or an opportunity for the market to grow. I particularly agree with the growth of the online learning segment, technological advancement, and career-focused education. However, I believe the report overlooks important changes in how students are evaluating their postsecondary options. I believe that Technavio could have given greater attention to the growing appeal of community colleges and vocational schools for many reasons. This is particularly important and something I was anticipating when reading the report because of the end-user segments which they didn't mention the impact much at all. Students are

Professor Barnshaw

increasingly considering the cost, length, and direct career benefit of their educational options. Shorter programs can provide students with industry-specific skills and pathways into the workforce in less time and, in many cases, at a lower cost than traditional four-year programs which directly relates to the driver trends that were outlined in the report. Therefore, I believe the increased appeal of shorter-term educational opportunities should hold a significant piece in this market's report,

Finally, while I agree that institutions are expanding online educational opportunities, I do believe this has had a negative impact on how society views the value of higher education degrees which I was expecting to see depicted in this report. This conclusion is based on numerous statistics demonstrating differences in the return on investment (ROI) associated with higher education degrees across fields such as business, education, and the humanities. As the cost and time required to complete traditional degree programs continue to be considered by students, shorter, more flexible, and more affordable educational pathways may become increasingly attractive alternatives. Trends that I have just outlined can affect certain aspects of the higher education market such as enrollment rates, revenue stream, and ultimately, stunt the growth of the market. This growing trend in the market is important because the growth of online programs, community college, micro-credential, and vocational education may reflect the market adapting to changing expectations of what students believe their education should provide in return for their time and financial investment.

Part III: Implications

If Technavio's analysis and projections are correct, the higher education market will be facing immense pressure to become more affordable, accessible, workforce aligned, and competitive on a global scale for the next 5-10 years. One potential implication is that affordability and system funding pressures will become increasingly important for both students and institutions. As students become more aware of the financial investment associated with higher education and compare educational degrees with less expensive alternative options, colleges and universities are facing greater pressure to demonstrate the value of their programs. At the same time, emerging technologies, online learning, and student support all require money which are expected to shape the future of the market. Facing the competition of other institutions, they will need continuous funding to invest in themselves, their programs, and their resources. Between maintaining affordable educational opportunities and continuously having the funding to modernize institutions, it can be a struggle to maintain that balance. The second implication is the disconnect between the curriculum and workforce demands which puts pressure on institutions to redesign their programs. Technavio identifies the gap between the skills taught through higher education and the skills expected by employers as a challenge for the market (Technavio, 2026). If this gap continues, higher education will have to include micro-credentials and career-focused programs that better align and prepare students for the workforce. Post-graduation outcomes may become an important measure of institutional effectiveness.

Lastly, unfavorable demographic trends are likely to increase competition among higher education institutions. Changes in the size of the traditional college age population could make it more difficult to maintain enrollment, especially with more flexible and affordable options becoming available to them. Institutions could respond to this by offering more flexible educational opportunities, accept non-traditional learners or widening the parameters of the types of learners they accept, and develop shorter educational pathways. Overall, these implications suggest that higher education institutions will need to adapt not only to technological changes but also to changing student expectations, workforce demands, financial pressures, and demographic conditions.
